

Circular solar power generation is not afraid of winter

Can solar panels generate electricity in the winter?

The short answer is yes! Solar panels can still generate electricity in the winter. However, data shows that energy generation can drop to an eighth of what it would be on a summer day, so choosing solar panels designed to optimise energy production all year round is essential.

Should you have solar panels in the winter?

However, there are some advantages to having solar panels in the winter. For starters, it can get too hot for solar panels in the summer - with solar panel efficiency starting to reduce as temperatures reach above 25°C. This isn't an issue in the winter, since temperatures in the UK stay between 2°C and 7°C, on average.

Are solar panels a viable option in winter?

As solar panels need daylight rather than heat, they can still generate electricity during the frosty season - although they might not be as effective because of a combination of factors associated with winter: But even with these challenges, solar panels are still a viable option for sustainable energy all year round.

Can solar panels work in winter in the UK?

Despite the days being shorter, solar panels can still work effectively during winter in the UK, especially on clear days. We've seen that cold weather can boost output, and though snow can be a bit of a hassle, you can still take full advantage of the winter sunshine with some well-positioned panels and proper care.

What happens to solar panels in winter?

Your solar panel output will typically be lower in winter. During these months, the days are shorter and the sun stays lower in the sky - meaning your panels will receive less daylight and less direct sunshine. However, your solar & battery system will benefit from the colder weather.

Does cold weather affect solar panels?

Cold weather doesn't affect solar panel performance (unless temperatures go below -40°C), since they operate on sunlight, which is still available in winter in the UK - albeit, at much lower levels than in the summer. This is one reason why solar panels generate less electricity in winter - the days are just shorter.
