

Is cold pressing or hot pressing better for photovoltaic brackets

Can cold isostatic pressing improve the power conversion efficiency of perovskite solar cells?

E-mail: zhiliang.ku@whut.edu.cn The cold isostatic pressing method was used as a post-treatment process for enhancing the power conversion efficiency and stability of carbon-based perovskite solar cells without hole transport materials.

Can an isostatic press form an HTL/carbon interface?

Here, we describe a lamination technique using an isostatic press that can apply exceedingly high pressure to physically form an HTL/carbon interface on par with vacuum-evaporated electrodes, without damaging the device.

How can a isostatic press be used to evaporate pre-coated electrodes?

Using the isostatic press, extremely high pressure could be applied without localised stress to laminate pre-coated electrodes from a carrier film to the PSC device stack to form an effective physical and electrical contact at the interface between the electrode and HTL, on par with vacuum evaporation deposition.

Does hot-pressing method affect PCE performance in planar PSCs?

Carbon electrode made by hot-pressing method demonstrated high conductivity and strong adhesion in planar PSCs. The effect of applied temperature in hot-pressing method on device performance was investigated systematically. Over 15% of PCE for the devices with eliminated hysteresis and outstanding reproducibility were obtained.

How does hot-pressing improve the performance of carbon electrodes?

After optimizing the applied temperature, we found both the electrical and mechanical properties of the carbon electrode were significantly enhanced by using the hot-pressing process at 80 °C, leading to remarkable enhancement of the device performance. An outstanding PCE of 15.3% with high reproducibility and negligible hysteresis was obtained.

What is photovoltaic performance boosting?

This photovoltaic performance boosting is ascribed to the improved open-circuit voltage (V_{oc}) from 1.0 V-1.08 V, the increased short-current density (J_{sc}) from 19.3 mA/cm² to 20.2 mA/cm² as well as the enhanced fill factor (FF) from 48.7% to 66.5%.
