

Who owns a microgrid?

According to Navigant Research ,the majority of grid-tied microgrids today are owned and financed by facility owners,especially in the campus/institutional category. It is important to recognize that microgrids,especially community microgrids,can utilize the existing distribution system infrastructure,radically reducing their costs.

When was the first microgrid built?

According to Pike Research,the first "modern industrial microgrid in the United States was a 64 MW facility constructed in 1955at the Whitling Refinery in Indiana," but most people are not aware the concept is much older. The microgrid concept dates back to the beginning of our industry.

What is a microgrid?

An EU research project describes a microgrid as comprising Low-Voltage (LV) distribution systems with distributed energy resources(DERs) (microturbines,fuel cells,photovoltaics (PV),etc.),storage devices (batteries,flywheels) energy storage system and flexible loads.

Are microgrids a viable business model?

The ownership and business models of microgrids are still evolving. Microgrids are now emerging from lab benches and pilot demonstration sites into commercial markets, driven by technological improvements, falling costs, a proven track record, and growing recognition of their benefits.

What is a stand-alone microgrid?

A stand-alone microgrid or isolated microgrid,sometimes called an "island grid",only operates off-the-grid and cannot be connected to a wider electric power system. They are usually designed for geographical islands or for rural electrification.

What can a microgrid power?

A microgrid can also power just a key portion of its area,such as emergency services and government facilities. For most of its history,the electric grid has relied mainly on large,central power stations,using resources like coal,hydropower and nuclear power.
