#### What is a microgrid & how does it work?

A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. It can connect and disconnect from the grid to operate in grid-connected or island mode. Microgrids can improve customer reliability and resilience to grid disturbances.

#### Why should you invest in a microgrid?

Enterprises are more motivated than ever to control energy costs and increase sustainability, while the utility grids they rely on grow more vulnerable due to aging infrastructure, extreme weather, and rising energy demand. A microgrid can help your organization achieve its goals and control its energy future- with or without capital investment.

#### What is a microgrid der?

DERs are power resources outside a central grid,including microgrid generation and storage systems. A microgrid controller automatically connects and disconnects these from the macro grid by remotely opening or closing a circuit breaker or switch.

#### How much does a microgrid cost?

The investment cost and operating cost are calculated to be2135 USD/kWand 0.066 USD/kWh respectively,both figures being higher than those of pulverized-coal and natural gas. It is projected that by 2025 the costs of renewable energy microgrids will begin to be competitive with non-renewable energy generation.

## Should a state invest in a microgrid?

Rather than that, the results suggest a state investment over private investment, as the current state of financial structure enables state entities to enjoy the advantages of microgrid establishment more than private investors.

## Should a microgrid be integrated with a utility grid?

To do this seamlessly, the microgrid should be integrated with the utility's automation systems at the substation and distribution levels. By connecting a microgrid to the utility grid as a DER, you can help increase the role of renewables on the grid and improve grid resilience.
