What is a wind turbine generator?

Wind turbine generators, often simply referred to as wind turbines, are innovative devices that harness the power of wind and convert it into usable electricity. They are a crucial part of the transition towards clean, renewable energy sources, and their use is steadily increasing worldwide.

What is wind power?

Wind power is a form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy that can be used for power. Wind power is considered a form of renewable energy. Modern commercial wind turbines produce electricity by using rotational energy to drive a generator.

How much energy does a wind turbine produce?

When operating at design wind speeds of over 12 mph, the five 1.5 MW wind turbines at this facility are capable of producing up to 7.5 MW of electrical energy. Since this is much more than the average 2.5 MW of power needed each day by this facility, the remaining energy is sold to the local power grid.

What are the different types of wind turbine generators?

Let's find out. There are many different types of generators used today in wind turbines, but the most common types are asynchronous generators. The two types most commonly used are the squirrel cage induction generator and the wound rotor induction generator--also known as a doubly feed induction generator (DFIG).

What is a wind turbine & how does it work?

A wind turbine is a device that converts the kinetic energy of wind into electrical energy. As of 2020, hundreds of thousands of large turbines, in installations known as wind farms, were generating over 650 gigawatts of power, with 60 GW added each year.

How do you get power from wind energy?

There are several ways to get power from wind energy. Wind turbines can be built on land, on lakes or in the ocean, in remote wilderness far from the power grid, within cities, or across vast plains. One wind turbine can power an individual home or farm, but several built close together form a wind energy plant, or wind farm.

The wind turbines that transfer electricity to the grid are either based on land (onshore) or at sea (offshore). Conglomerations of wind turbines are known as wind farms. In 2022 wind energy accounted for 7.33% of worldwide electricity ...
