

Principles of harmonic control in microgrids

What is the nature of microgrid?

The nature of microgrid is random and intermittent compared to regular grid. Different microgrid structures with their comparative analyses are illustrated here. Different control schemes, basic control schemes like the centralized, decentralized, and distributed control, and multilevel control schemes like the hierarchal control are discussed.

What are the advanced control techniques for frequency regulation in micro-grids?

This review comprehensively discusses the advanced control techniques for frequency regulation in micro-grids namely model predictive control, adaptive control, sliding mode control, h-infinity control, back-stepping control, (Disturbance estimation technique) kalman state estimator-based strategies, and intelligent control methods.

What is hierarchical control in microgrids?

The responsibility of the hierarchical control level is to provide control over the production of power from renewable sources. This paper comprehensively investigates the principles of hierarchical control in microgrids from a technical point of view.

Which control strategies are proposed to mitigate harmonics?

The control strategies proposed to mitigate harmonics are classified into three groups: primary,secondary,and tertiary. Furthermore,this overview draws a sketch on the global trends in harmonic mitigation methods of an ac microgrid directly applicable to today's smart grid applications. Why are voltage and current harmonics important in microgrids?

Voltage and current harmonics are an important power quality concernin single-phase microgrids. Harmonic distortion increases the power losses and may cause stability problems particularly in islanded microgrids. Current harmonics can be injected by the DG units due to poorly designed control loops.

Are harmonic mitigation methods a hierarchical control strategy?

Hence, the main goal of this article is to clearly present a comprehensive review of harmonic mitigation methods from a hierarchical control viewpoint. The control strategies proposed to mitigate harmonics are classified into three groups: primary, secondary, and tertiary.
