

Solar bracket pool photography

What is bracketing in photography?

Bracketing is a camera technique where you capture several different exposures of the same scene. In other words, you capture a standard image (below, top), a darker/underexposed version (below, bottom left), and a brighter/overexposed version (below, bottom right): Each composition is identical, yet the exposure level varies from shot to shot.

Why should you bracket your photos?

But there's a second reason to bracket your images, one that's very popular among landscape and cityscape photographers in particular: Bracketing lets you capture high dynamic range (HDR) photos. The dynamic range of a scene refers to the difference between its lightest lights and its darkest darks.

Should you bracket a sunset photo?

In particular, bracket your sunrise and sunset landscape shots, as well as any cityscape shots taken at sunrise, sunset, or at night. Second, if you're capturing an unusually dark or an unusually light scene, it pays to bracket, because your camera often gets the exposure wrong.

How do you use a bracketed image in Photoshop?

Fortunately, there's an easy solution: Instead of capturing one image of the scene, you bracket. And then you blend all of your bracketed images together in a post-processing program. That way, you can use the detailed highlights from one image, the detailed midtones from another image, and the detailed shadows from a third image.

Why should you use Autostakkert for solar photography?

Remember, safety first! With the right camera settings, knowledge, and certified solar filters, you can embark on your solar photography journey, capturing the sun's magnificence safely and responsibly. Once you have the images, you can bring out greater detail by stacking the images together with AutoStakkert.
