

Under the new procedures, businesses no longer need to seek approval from Greece's electricity regulator or obtain an environmental permit as part of the application process for installing solar panels.

The Greek renewable energy transition has its origin in the 1990s when the country first introduced a feed-in tariff. The road since then has been a bumpy one, yet Greece's government issued a draft proposal whereby the country is to reach a 40 percent renewable electricity target by 2020.

The development of solar power in Greece started in 2006 but peaked only in 2009 and, as of December 2013, the total installed photovoltaic capacity in Greece reached 2,419.2 MWp. In April 2022, the Greek Prime Minister, Kyriakos Mitsotakis, inaugurated a new solar park in Kozani, the country's Western Macedonia region.

Greece is expected to bring online between 1.6 GW and 1.7 GW of fresh solar photovoltaic (PV) capacity in 2023 and beat its year-ago annual additions of 1.4 GW, according to data by SolarPower Europe.

Solar power in Greece has been driven by a combination of government incentives and equipment cost reductions. The installation boom started in the late 2000s with feed-in tariffs has evolved into a market featuring auctions, power purchase agreements, and self-generation. [1]

Greece's Solar Rooftop Country Profile. April 2024. Red = 0-1 points. Orange = 2-3 points. Green = 4-5 points. This country profile highlights the good and the bad policies. and practices of solar rooftop PV development within Greece. It examines and scores six key areas: governance, incentives & support schemes, permitting procedures, energy ...

New incentives and simplified procedures for the PV and storage market. According to the studies of Solar Power Europe, the Greek government is working to further streamline the authorization process. After having facilitated the market in 2020 is expected that incentives may also arise for the storage market.

The Regulatory Authority for Energy issued 30 production certificates for investors in renewable sources. It is the first batch of applications for which Greece implemented its new regulations as it scrapped the production license and merged stages in the procedure. The future solar and wind power plants are planned to have a

capacity of 307 MW.

In 2022, Greece will launch the largest solar power plant construction project in the Eastern Mediterranean, with photovoltaic facilities worth up to 130 million euros. This 205-megawatt power plant will generate enough electricity to power 75,000 households and will reduce more than 300,000 households per year. tons of carbon dioxide emissions.
