

Space solar power generation technology research and development

What is a research trend on space-based solar power?

Research trend on space-based solar power. A research trend for SBSP has been formed along with interest in SBSP and historical research and development trends. In 1968, the concept of SBSP was researched and technically implemented by Dr. Peter Glaser [46], and he published the first paper on the subject in 1976 [47].

What is space-based solar power development?

Space-based solar power development is complex due to the scale and integration requirements of the system. When completed, the solar power satellite would be the largest and heaviest in orbit. The performance of the power-to-mass ratio (kW/kg) is critical.

Could space-based solar power deliver cost-competitive electricity generation?

While requiring substantial development, space-based solar power (SBSP) could deliver cost-competitive electricity generation, de-risking the path by providing a future source of clean, base-load energy by 2040 or earlier.

What is space-based solar power (SBSP)?

In contrast, space-based solar power (SBSP) systems enable the utilization of 99 % of solar energy 24 h a day. However, while SBSP has shown the potential to produce a more stable power supply and sustainability, it is still in the early stages of its evolution, requiring further research and development.

Which countries are developing space-based solar power systems?

Many nations are developing space-based solar power systems. US, UK, China, and Japan have major national policy-driven projects. All sides have a genuine and strong desire for cross-border collaboration.
