

Wind power guarantees direct trading of external power generation

What is green power trading mechanism?

The green power trading mechanism is an effective approach to boost green power development through exclusive market price incentives, resulting in a higher green power generation that 1067.2 TWH generation with a combined mechanism including the green power and TGC markets and 1073.4 under the GP market only.

Does Green Power Trading mechanism affect power generation and interregional transmission?

This study has constructed a high-resolution power market equilibrium model (HREM) considering the participation of consumers, producers, and ISO in different markets. It illustrates the impact of green power trading mechanism on power generation and interregional transmission in China, which can heavily affect green power development.

Who participates in the green power trading market?

The green power trading market is mainly participated by three parties, including enterprises with green power demand, green power trading platform and renewable energy power generation enterprises. The two trading centers are set up in Beijing and Guangzhou, respectively.

Do specialized companies benefit from green power trading?

We find that the impact of green power trading is significant for enterprises specializing in wind or photovoltaic power generation, while for those comprehensive enterprises, the impact is insignificant. This result shows that companies with a specialized orientation are better positioned to benefit from green power trading.

Why is China launching green power trading in 2021?

For this purpose, China made an institutional innovation in its electricity market with its official launch of green power trading on September 7, 2021. This policy allows and advocates the direct transaction between the power consumption enterprises and all wind power and photovoltaic power generation enterprises.

Does China's green power trading policy alleviate debt pressure?

To sum up, we conclude that the core finding of this paper is robust, namely, China's green power trading policy does significantly alleviate the debt pressure of power generation enterprises covered by the policy. 4.4. Heterogeneous analysis

DOI: 10.1016/J.IJEPES.2015.11.080 Corpus ID: 109995761; A combined external delivery optimization model for wind power and thermal power considering carbon trading and tradable ...

As for the compensation to be provided for the amount of electricity produced or curtailed within the scope of

Wind power guarantees direct trading of external power generation

guaranteed purchases, the power grid enterprises are to assist ...

As electric machines and drives are core components in wind turbines, it is a pressing need for researchers and engineers to develop advanced electric machines and drives for wind power generation.
