

Wind turbine generator collector ring

What is a generator collector ring?

These rings are specialized types of electrical slip rings used primarily for transferring power and electrical signals from a stationary to a rotating structure, hence forming an integral part of the power generation apparatus. A generator collector ring is essentially a rotating metal ring that is connected to the spinning rotor of a generator.

What is a wind turbine slip ring?

So a wind turbine slip ring can be provided with a single contact material that will handle high power as well as data communication channels. The primary advantage of the fiber brush design is that 100 million revolutions can be achieved in wind turbine blade pitch applications with no maintenance.

How does a wind turbine collection system work?

The collection system primarily uses the 33-36 kV AC inter-array cable to collect the energy from the wind turbines. This voltage range is preferred considering the cross section of the towers. An array of medium voltage submarine cables connects the wind turbine output to the offshore substation.

What is a collector ring?

Collector rings reside at the heart of power transmission within a generator system. This seemingly simple interface bears the full onus for the delivery of generated power to its intended destination without interruption. They allow the circuit between the rotor and the stator to be completed, thereby accommodating continuous electricity flow.

Do wind turbine slip rings cause arcing?

Historically wind turbine slip rings have been constructed with carbon-based brushes using standard industrial grade materials, and wear debris generation has been a problem causing arcing or short circuits in the power section and high contact noise in the signal section.

How does a generator rotor work?

The rotor winding is connected to the generator collector ring--a conductive circle, typically made of copper or another conductive alloy. As the generator rotor revolves, so do these rings. The challenge, however, is to transfer the electrical power from the constantly spinning collector ring to the stationary stator.
